4 Gardner St., Allston, MA | (847) 648-1332 | wimerbrooks@gmail.com | LinkedIn | GitHub | Portfolio

EDUCATION

Boston University

Jan 2021 – May 2025

Computer Science (GPA: 3.74)

- **Achievements:** Deans Advisory Board, Peer Tutor, Deans List, Teacher's Assistant

CODING EXPERIENCE

Maverick | *TypeScript · Node.js · Discord.js · SQLite · Claude Code · Codex CLI*

Jan 2025 – Present

- Built an AI agent orchestration platform controlled via Discord — routes software engineering tasks to Claude Code and Codex agents across concurrent projects
- Implements structured pipelines (intake → plan → implement → verify → review) with persistent SQLite state, git worktree isolation per task, and pluggable AI backends
- Supports concurrent multi-project workflows; agents surface results and diffs back to the operator through Discord with a full audit trail per task

SyncSonic | *Python · BLE GATT · React Native · Shell*

Feb 2025 – Present

- Built the first open-source, brand-agnostic multi-speaker Bluetooth audio orchestrator — synchronizes 5+ speakers from any manufacturer simultaneously
- Programmed Raspberry Pi + multiple USB Bluetooth adapters with a deterministic state machine per device handling discovery, pairing, trust, connection, and audio loopback
- Built a React Native mobile app (BLE GATT) for per-speaker volume, latency, and mute control

Kitbash | *Kotlin · Jetpack Compose*

Feb 2025 – May 2025

- Built an Android app (Jetpack Compose) that turns a phone into a fully customizable PC game controller — drag-and-drop layout builder with button, joystick, D-pad, voice, and motion controls

Capacity Deviation Display | *R · SQL · JS · CSS · HTML*

Sep 2024 – Nov 2024

- Built a live dashboard used by power grid operators to monitor real-time capacity deviations
- Enabled faster emergency response by consolidating capacity metrics into a single real-time view, eliminating manual data collection across disparate systems

Emergency Notification System | *Python · SQL · Selenium*

May 2024 – Sep 2024

- Built Python + Selenium tooling to synchronize two disconnected operator data sources for the Emergency Notification System, keeping escalation paths accurate during grid events

API Template and Instructions | *Java · XML · Python*

May 2024 – Aug 2024

- Authored a 60-page API guide and interactive GUI training tool covering every endpoint, schema, and workflow for renewable energy data submission
- Built a GUI-based Python API template so operators could submit data without writing code, removing the technical barrier driving non-compliance
- Directly enabled 30% of previously non-compliant renewable energy plants to meet mandated data submission requirements for ISO New England

WORK EXPERIENCE

Collette | *Software Engineer I · Strategic Initiatives*

Sep 2025 – Present

- Design and develop RESTful APIs supporting core travel services including Booking, Payments, and Air systems on the Strategic Initiatives modernization team
- Led rework of the payment processing flow through the booking API, preserving full backwards compatibility with the existing legacy system throughout migration
- Contribute to company-wide initiative migrating legacy SOAP-based and stored-procedure-heavy VB services to modern C# REST architecture

Corso | *Full Stack Engineer Intern*

Jan 2025 – Apr 2025

- Built a Next.js web application for AI-powered analytics and visualization of construction permits and regulatory data — owned full-stack implementation including data pipeline, API layer, and interactive frontend dashboard

ISO New England | *Software Development Intern*

Jun 2024 – Jan 2025

- Built a real-time capacity deviation dashboard used live by control room operators to monitor grid stability — replaced manual data collection with a consolidated single view
- Engineered Emergency Notification tooling that synchronized two disconnected operator data sources, ensuring escalation accuracy and eliminating manual entry during grid events
- Delivered 60-page API documentation and GUI-based template that brought 30% of non-compliant renewable energy plants into mandated data submission compliance

Boston University | *Teacher Assistant · C# Full Stack App Dev*

Sep 2023 – May 2025

- Developed curriculum, taught classes, and mentored students in conceptualizing and building novel C# full-stack applications

Talitha | *CPG Research Analyst*

May 2023 – May 2024

- Collaborated with the M&A team to analyze Salesforce data, identify potential acquisition targets, and streamline the acquisition process

TECHNOLOGIES:

- Programming Languages: Python, TypeScript, JavaScript, C#, Java, C, R, C++, HTML, CSS, SQL, XML | Frameworks & Tools: Node.js, React Native, Next.js, .NET/ASP.NET, BLE/GATT, Git, SQLite, Firebase, Selenium, Linux/Raspberry Pi
